# SAE Inc. Standard No. 104 Density of Uncured Latex-Based Products 

## ABSTRACT

This test method is used to calculate the density of SAE's uncured latex-based products in slurry form. The volume per pail of products such as ConduFlow or ConduForm can also be calculated.

## 1. EQUIPMENT REQUIRED

1.1 Electronic balance accurate to 0.005 kg
1.2 Tape measure or ruler
1.3 Beaker

## 2. PROCEDURE

2.1 Weigh an empty 5 US gallon pail on a scale accurate to +/- 0.005 kg and leave the pail on the scale.
2.2 Pour the required amount of the product into the 5 US gallon pail, e.g. 19.2 kg for ConduFlow or 19.4 kg for ConduForm, and record the height of product in the pail and the weight of the product.
2.3 Pour the product out of the pail and dispose accordingly.
2.4 Fill the pail with water, keeping a record of the volume of water added in liters, until the height of the water reaches the height that the product was in the pail.

## 3. CALCULATIONS

3.1 To calculate the volume of the product convert the volume of water from liters to cubic meters:

$$
\begin{aligned}
& v_{\text {product }}=m^{3}{ }_{\text {water }}=\frac{L_{\text {water }}}{1000} \\
& \text { where, } \\
& v_{\text {product }} \text { is the colume of the product in } \mathrm{m}^{3} \\
& \mathrm{~m}^{3} \text { water }=\text { cubic meters } \\
& \mathrm{L}_{\text {water }}=\text { liters }
\end{aligned}
$$

3.2 Calculate the density of the uncured product:

$$
D=\frac{m}{V}
$$

where,
$D=$ Density in kg/m³
$\mathrm{m}=$ Mass in kg
$V=$ Volume in $\mathrm{m}^{3}$
3.3 Calculate the density of the uncured product in $\mathrm{Ibs} / \mathrm{ft}^{3}$ :
$7 \mathrm{~kg} / \mathrm{m}^{3}=0.0624 \mathrm{lbs} / \mathrm{ft}^{3}$
3.4 Report the density of the uncured product in $\mathrm{kg} / \mathrm{m}^{3}$ and $\mathrm{lbs} / \mathrm{ft}^{3}$.
